The Boolean Lamp and Pendant

Industrial design, product design

A hand blown pendant and table lamp, shaped by subtracting the aluminum clip light from a bubble of glass.

THE WORK

The Boolean Lamp starts from the ubiquitous aluminum clip light, the work light in every shop, and looks for luxury in the everyday.

THE MATERIAL QUESTION

The name is the method. The lamp's shape is a boolean: the clip light subtracted from a bubble of glass, so the interior of the shade is determined by the exterior of the original aluminum light. The two are connected in lineage, and the glass had to carry that exact geometry.

THE MAKING

Each one is blown by glass artisans in Chicago, one at a time, the result of an iterative design process. Variations in color, texture, and shape make each lamp its own within a consistent form. Glass in smoke, umber, or light blue, on a base of cast concrete, aluminum, or acrylic, as a pendant or a table lamp.

IN PLACE

Our best selling object to date, sold to businesses overseas and at home and into many luxury kitchens and homes. The pendant also scaled up into the Kuma's Corner West Loop interior, circling the bar.
