Woven Vessels

Candone Wharton

Cast lead crystal vessels molded from the artist's earthenware originals.

THE WORK

Candone Wharton works in ceramic, black earthenware and sometimes terracotta. Her vessels look woven but are ceramic, and she wanted to see pieces she had loved for a long time come to life in a new material and a new palette: purples, lime greens, jades.

THE MATERIAL QUESTION

Something woven, made to let light through. Turning an opaque ceramic translucent gives the piece a second life in its shadows and lets it glow from within, but only if the weave survives the mold.

THE MAKING

As mold makers we preserve originals wherever we can. The earthenware got the same natural water soluble sealer as Maria Gaspar's Jail Debris; we molded it and cast in lead crystal, and the originals came back intact for her to show.

IN PLACE

"There's a lot of optical spice in the combination of something woven and then allowing light to pass through it," says Ally Reza.
