The Boolean Lamp and Pendant

Industrial design, product design

A hand blown pendant and table lamp built from a boolean intersection of two primitive forms.

THE WORK

The Boolean Lamp starts from the ubiquitous aluminum clip light, the work light in every shop, and looks for luxury in the everyday.

THE MATERIAL QUESTION

Its geometry is a boolean intersection of two primitive volumes, a clean digital operation. The question was whether hand blown glass could hold it.

THE MAKING

Each one is blown by glass artisans in Chicago, one at a time, the result of an iterative design process. Variations in color, texture, and shape make each lamp its own within a consistent form. Glass in smoke, umber, or light blue, on a base of cast concrete, aluminum, or acrylic, as a pendant or a table lamp.

IN PLACE

The pendant later scaled into the Kuma's Corner West Loop interior, circling the bar and filling the west wall portals.
