Jardin de Gargolas

YolloCalli Arts Reach

Student designed garden gargoyles taken from 3D model to cast aluminum sculpture.

THE WORK

Little Village teens with Yollocalli Arts Reach, the youth initiative of the National Museum of Mexican Art, designed their own garden gargoyles in 3D software. The idea grew from a rainwater garden and a bird bath, and the gargoyles are destined for Jardin Malinalli, the museum's youth garden in Pilsen and Little Village.

THE MATERIAL QUESTION

A file on a screen had to become a permanent metal object, and the translation had to stay true to what each student made.

THE MAKING

We printed the sculptures in house and used the prints as positives in a resin bonded sand mold, a lost PLA process that turns a digital design directly into its metal duplicate. Cast in aluminum, welded, finished in a dark patina. With teaching artist Secret of Manna, the class became a fabrication and exhibition class, with professional tools in young artists' hands.

IN PLACE

Unveiled in April 2024 in the museum courtyard, as part of the exhibition New Age Grotesque. Each student pulled a one-of-a-kind creature out of the sand.
